1. Introduction

1.1. Purpose

The purpose of this document is to define the functional and non-functional requirements for the "Mini App – User Registration & Authentication" system. This document serves as a blueprint for the implementation phase, detailing the system flow for user registration, secure login, and session management.

1.2. Scope

The system is a web-based application designed to demonstrate secure identity management. The boundaries of the system include:

- **User Registration:** Allowing new users to create an account by providing personal details.
- **Authentication:** Verifying user identity via email and password (Login).
- **Authorization:** Granting access to the protected Dashboard only to logged-in users.
- **Session Management:** Securely logging out and clearing user sessions.

1.3. Definitions, Acronyms, and Abbreviations

- **FRS:** Functional Requirements Specification.
- **JWT (JSON Web Token):** A standard method for securely transmitting information between parties as a JSON object, used here for maintaining user sessions.
- **BCrypt:** A password-hashing algorithm used to encrypt passwords before storage.
- **API:** Application Programming Interface.

2. Overall Description

2.1. System Perspective

This system operates as a standalone web application utilizing a Client-Server architecture.

- **Frontend:** React.js application serving as the User Interface.
- **Backend:** Spring Boot API handling business logic and security.

- **Database:** Relational database (MySQL) for storing user credentials.

2.2. User Classes and Characteristics

- **Guest User:** An unauthenticated user. They have limited access permissions and can only view the Login and Registration pages.
- **Authenticated User:** A user who has successfully logged in. They have full access permissions to view the Dashboard and use the Logout function.

2.3. Operating Environment

- **Client Side:** Modern Web Browser (Chrome, Edge, Firefox).
- **Server Side:** Java Development Kit (JDK) 17+, Spring Boot Framework.
- **Database:** MySQL.
- **Tools:** Draw.io (Diagramming), Postman (API Testing).

2.4. Assumptions and Dependencies

- It is assumed that the database server is running and accessible by the API.
- The system depends on the Spring Security library for handling authentication protocols.
- Passwords must be hashed before storage; plain text storage is prohibited.

3. System Features and Functional Requirements

Describe each major feature of the system and its functional requirements.

3.1. Feature 1:

User Registration Description: This feature allows a Guest User to create a new account by providing their personal details. The system validates the input and stores the password securely.

Functional Requirements:

- **REQ-1.1:** The system shall accept First Name, Last Name, Email, and Password as input.
- **REQ-1.2:** The system shall verify that the email address is not already registered in the database.
- **REQ-1.3:** The system must encrypt the user's password using BCrypt before saving it.
- **REQ-1.4:** Upon successful registration, the system shall redirect the user to the Login page.

3.2. Feature 2:

Authentication & Session Management Description: This feature handles the secure login process, dashboard access, and logout capabilities.

Functional Requirements:

- **REQ-2.1:** The system shall validate the entered email and password against the database records.
- **REQ-2.2:** If credentials are valid, the system shall generate a session token (JWT) and grant access.
- **REQ-2.3:** The system shall restrict access to the "Dashboard" page; if a user is not logged in, they are redirected to Login.
- **REQ-2.4:** The system shall provide a "Logout" button that clears the stored session/token and redirects the user to the Login page.

4. Non-Functional Requirements

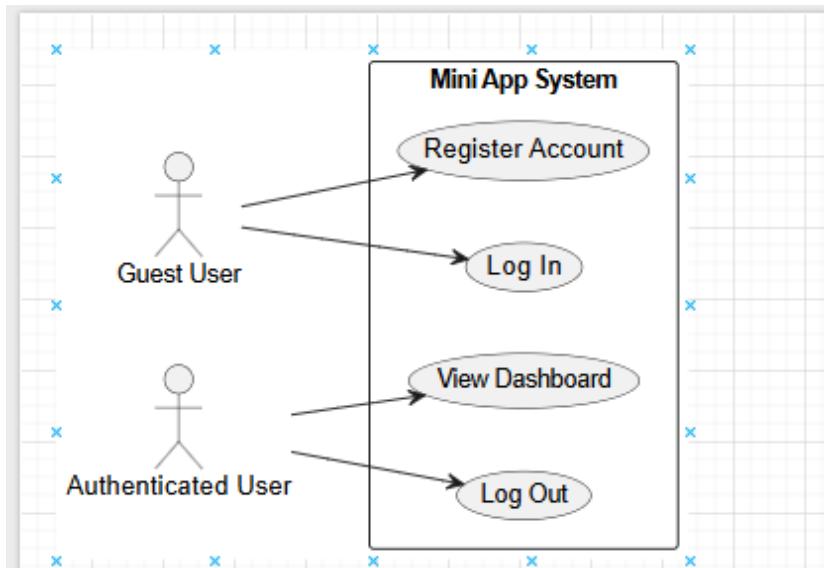

- **Security:** User passwords must never be stored in plain text. API endpoints for the dashboard must be protected by an authentication filter.
- **Performance:** Login and Registration transactions should complete within 2 seconds.
- **Usability:** The UI must be intuitive, clearly distinguishing between the "Register" and "Login" forms. Error messages (e.g., "Invalid Credentials") must be displayed clearly.
- **Reliability:** The system should handle database connection errors gracefully without crashing.

5. System Models (Diagrams)

5.1. ERD

USERS			
bigint	id	PK	Primary Key
string	email	UK	Unique, Not Null
string	password_hash		BCrypt Encrypted
string	first_name		
string	last_name		
string	role		Default: USER
timestamp	created_at		

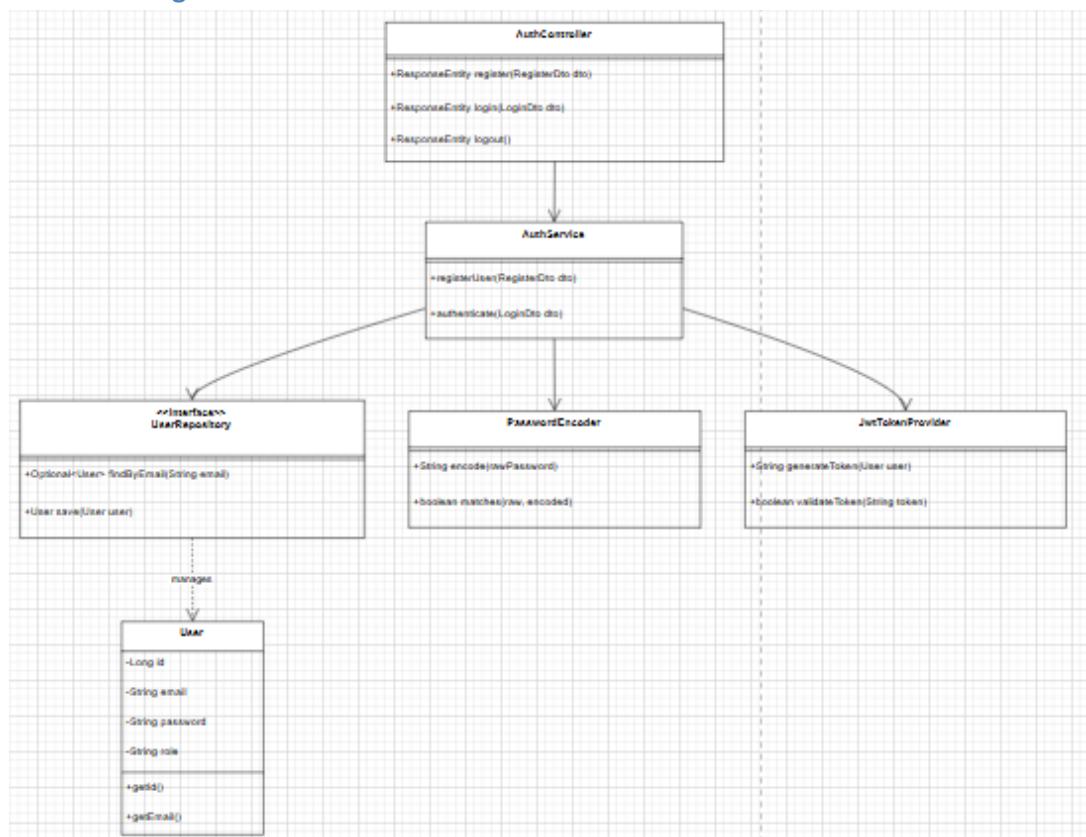

5.2. Use Case Diagram

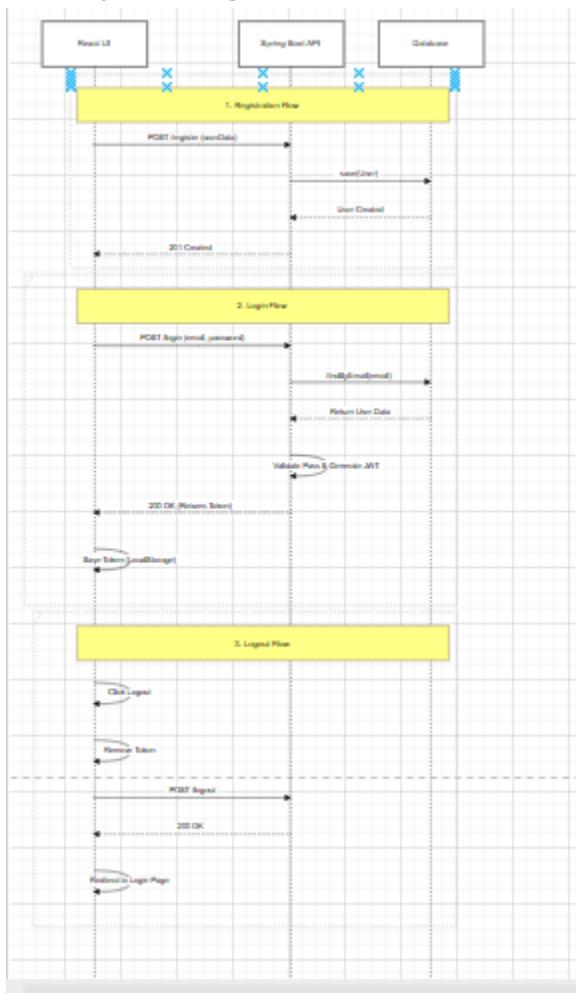

5.3. Activity Diagram

5.4. Class Diagram

5.5. Sequence Diagram

6. Appendices

- **Appendix A:** Laboratory Instruction Sheet (Mini App – User Registration & Authentication).
- **Appendix B:** Spring Security Documentation Reference.
